DATABASE MANAGEMENT SYSTEM PROJECT

COMMUNITY MANAGEMENT SYSTEM DURING COVID PANDEMIC

KURA VISHAL REDDY

NATIONAL INSTITUTE OF TECHNOLOGY WARANGAL

JULY '22

INTRODUCTION

In this project, I have designed a Database Management System to organize and store information about a community during the pandemic. This database contains data about residents, doctors assigned to them, residents who have tested positive for Covid-19 and whether they have recovered, and details about resident's vaccinations. It also stores information about the visitors and whom they are visiting. Through this project, we can efficiently store and retrieve crucial data that can avoid community transmission of Covid-19 by swiftly tracking down the source and isolating it.

ER MODEL ASSUMPTIONS

- An Owner can have multiple Residents living in his/her house.
- A Resident can have only one Owner. Each Owner's house has a Flat Number.
- An Owner can have multiple Visitors.
- A Visitor can go to any Flat and any Sector.
- Each Resident can have multiple logs in ResidentLog, one for each time they leave the community area.
- A Resident can be tested positive or negative for Covid.
- Each Vaccination can be given to one Resident. A Resident can take more than one dose of vaccination.
- Each Resident is allotted a Doctor. A Doctor can be allotted to multiple Residents but only in one Sector.

CREATION OF TABLES

1) OWNER:

```sql
CREATE TABLE Owner(
    Owner_Id INT PRIMARY KEY,
    Owner_Name VARCHAR(50),
    Sector INT,
    Flat_No INT,
    Contact VARCHAR(20),
    Email VARCHAR(50)
);
```

```sql
INSERT INTO Owner VALUES (801, 'Aditya Verma', 2, 202, '9345728394','aditya@gmail.com'),
                         (802, 'Rohan Sharma', 4, 402, '9562839237','rohan@gmail.com'),
                         (803, 'Sai Viswanadh', 3, 303, '8725704689','sai@gmail.com'),
                         (804, 'Adrika Dev', 2, 201, '9237534245','adrika@gmail.com'),
                         (805, 'Rohit Singh', 1, 101, '9163790421','rohit@gmail.com'),
                         (806, 'Tripti Patel', 1, 103, '8538019432','tripti@gmail.com'),
                         (807, 'Kavya Sinha', 4, 403, '9327301999','kavya@gmail.com'),
                         (808, 'Raj Singhania', 2, 203, '91000582249','raj@gmail.com'),
                         (809, 'Varun Malhotra', 3, 302, '96231119056','varun@gmail.com'),
                         (810, 'Vaibhav Malik', 3, 301, '8246678321','vaibhav@gmail.com'),
                         (811, 'Mohammed Maaz', 1, 102, '9666777553','maaz@gmail.com'),
                         (812, 'Sophia Charles', 4, 401, '8999302154','sophia@gmail.com');
```

NORMALISATION

1)OWNER

Functional Dependencies:

Owner_Id → Owner_Id,Owner_Name,Flat_No,Sector,Email,Contact

Flat_No→ Flat_No,Owner_Id,Owner_Name, Sector,Email,Contact

Closure OF Owner_Id:

$Owner\_Id^+$ = { Owner_Id,Owner_Name,Flat_No,Sector,Email,Contact}

Closure OF Flat_No:

$Flat\_No^+$ = { Flat_No,Owner_Id,Owner_Name, Sector,Email,Contact}

Candidate Keys: Owner_Id,Flat_No

Primary keys: Owner_Id

The given relation is in its highest normal form i.e, BCNF, since the LHS of all the functional dependencies are superkeys (OwnerID, DoorNo) for the relation

2)DOCTOR

Functional Dependencies:

DoctorID → DoctorID, Doctor Name, Sector

Sector → Sector, DoctorID, Doctor Name

Closure of DoctorID:

$DoctorID^+$ = {DoctorID, Doctor Name, Sector}

Closure of Sector:

$Sector^+$ = {Sector, DoctorID, Doctor Name}

Candidate Keys: DoctorID, Sector

Primary Key: DoctorID

The given relation is in its highest normal form i.e, BCNF, since the LHS of all the functional dependencies are superkeys (DoctorID, Sector) for the relation

3. RESIDENT

Functional Dependencies:

ResidentID → ResidentName, OwnerID, DoctorID, DOB, Sector, Flat_No

DoorNo → Sector

Doctor_Id→Sector

Closure of ResidentID:

ResidentID$^+$ = {ResidentName, OwnerID, DoctorID, DOB, Sector, Flat_No}

Closure of DoorNo:

DoorNo$^+$ = {Flat_No, Sector}

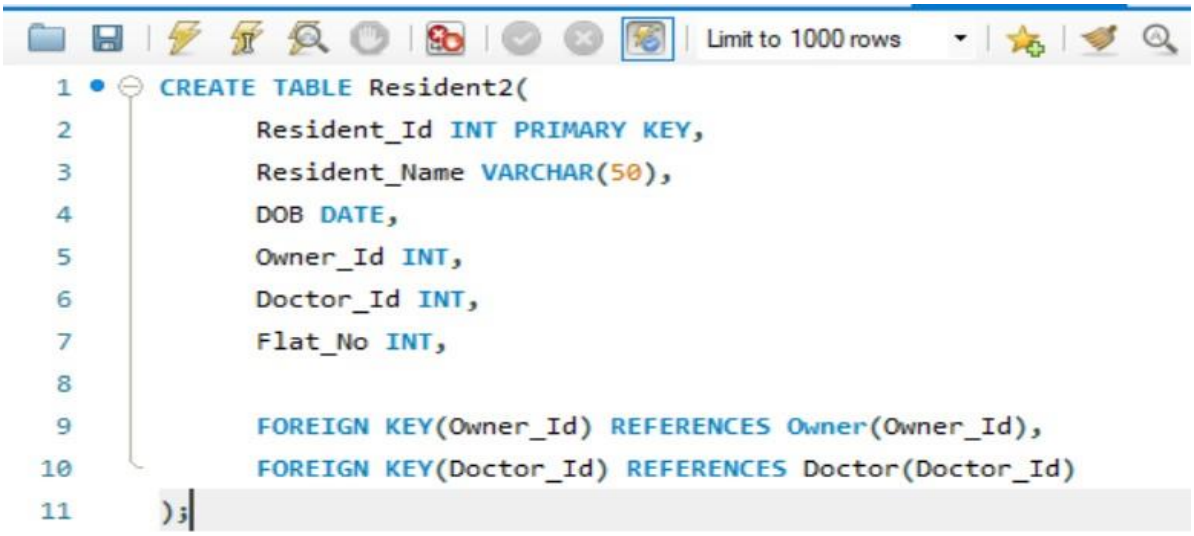
Closure of Doctor_Id:

Doctor_Id$^+$ = {Doctor_Id,Sector}

Candidate Keys: ResidentID

Primary Key: ResidentID

The given relation is not in BCNF because the LHS of the functional dependencies Flat_No → Sector and Doctor_Id→Sector i.e Flat_No and Doctor_Id is not a super key. The given relation is not in 3NF because the transitive functional dependencies exists. In the functional dependencies (Flat_No → Sector and Doctor_Id→Sector) both the LHS and RHS are non - prime attributes and therefore the relation is not in 3NF. The given relation is in 2NF because there are no partial dependencies, i.e., the proper subset of any candidate key doesn't determine a non prime attribute. To convert the given relation to a higher normal form, we decompose it into the following relations Resident2, Area , Doctor_Allotment.



```
INSERT INTO Resident2 VALUES (801, 'Aditya Verma', '1972-02-15',801,102, 202),

	820	Mohammad Razia	1978-04-19	810	103	102
▶	821	Steve Charles	1982-01-17	812	104	401
	822	Shrey Sinha	1971-08-11	807	104	403
*	NULL	NULL	NULL	NULL	NULL	NULL

Functional Dependencies:

Resident_Id → Resident_Id, Resident_Name, Owner_Id, Doctor_Id, DOB, Flat_No

Closure of ResidentID:

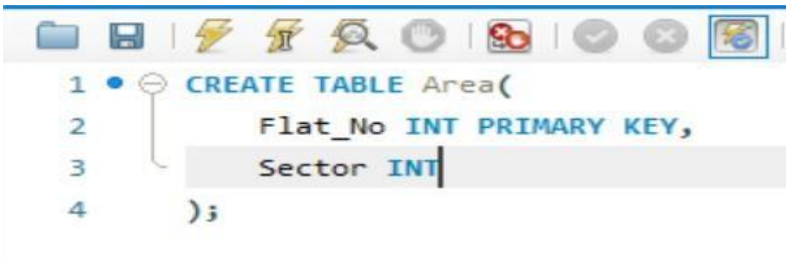
ResidentID$^+$ = {Resident_Id, Resident_Name, Owner_Id, Doctor_Id, DOB, Flat_No}

Candidate Keys: Resident_Id

Primary Key: Resident_Id

The given relation is in its highest normal form i.e, BCNF, since the LHS of all the functional dependencies are superkeys (Resident_Id) for the relation.

4)AREA



```sql
INSERT INTO Area VALUES (101, 1);
INSERT INTO Area VALUES (102, 1);
INSERT INTO Area VALUES (103, 1);
INSERT INTO Area VALUES (201, 2);
INSERT INTO Area VALUES (202, 2);
INSERT INTO Area VALUES (203, 2);
INSERT INTO Area VALUES (301, 3);
INSERT INTO Area VALUES (302, 3);
INSERT INTO Area VALUES (303, 3);
INSERT INTO Area VALUES (401, 4);
INSERT INTO Area VALUES (402, 4);
INSERT INTO Area VALUES (403, 4);
```

Flat_No	Sector
101	1
102	1
103	1
201	2
202	2
203	2
301	3
302	3
303	3
401	4
402	4
403	4
NULL	NULL

Functional Dependencies:

Flat_No → Sector

Closure of DoorNo: $Flat\_No^{+}$ = {Flat_No, Sector}

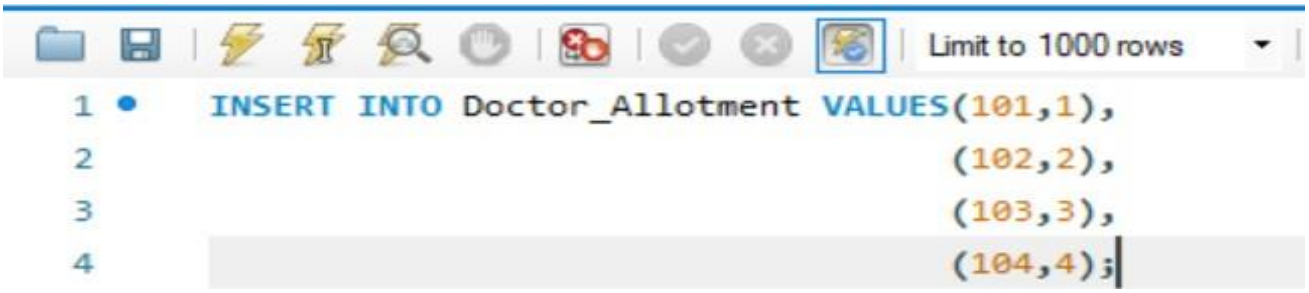
Candidate Keys: Flat_No

Primary Key: Flat_No

The given relation is in its highest normal form i.e, BCNF, since the LHS of all the functional dependencies are superkeys (Flat_No) for the relation.

5)DOCTOR_ALLOTMENT

```
1  CREATE TABLE Doctor_Allotment(
2          Doctor_Id INT PRIMARY KEY,
3          Sector INT
4  );
```



```
1  INSERT INTO Doctor_Allotment VALUES(101,1),
2                                     (102,2),
3                                     (103,3),
4                                     (104,4);
```

	Doctor_Id	Sector
▶	101	1
	102	2
	103	3
	104	4
*	NULL	NULL

Functional Dependencies:

Doctor_Id → Sector

Sector→Doctor_Id

Closure of Doctor_Id: Doctor_Id$^+$ = {Doctor_Id, Sector}

Closure of Sector: Sector+ = {Sector,Doctor_Id}

Candidate Keys: Doctor_Id,Sector

Primary Key: Doctor_Id

The given relation is in its highest normal form i.e, BCNF, since the LHS of all the functional dependencies are superkeys (Doctor_Id) for the relation.

To Ensure the Functional dependencies are preserved lets

F1 = Resident_Id→ Resident_Id,Resident_Name,Owner_Id,Doctor_Id,DOB,Flat_No.

F2 = Flat_No→Flat_No,Sector

F3 = Doctor_Id→Doctor_Id,Sector

F1 intersection F2 intersection F3 != NULL and

F1 intersection F2 = Flat_No which is Candidate key in F2

F1 intersection F3 = Doctor_Id which is candidate key in F3

There fore no functional dependencies are lost

Hence the decomposition is lossless

6)VISITOR

Functional Dependencies:

{Visitor_Id,Entry_Time} → Visitor_Id, Visitor_Name, Entry_Time, Exit_Time, Visiting_Purpose, Visiting_Date, Visiting_Flat_No

Candidate_Key: {VisitorID,Entry_Time}

Primary Key: {VisitorID,Entry_Time}

The given relation is in its highest normal form i.e, BCNF, since the LHS of all the functional dependencies are superkeys (VisitorID, Entry_time) for the relation.

7. RESIDENTLOG

Functional Dependencies:

{Resident_Id, Exit_Time} → {ResidentID, Exit_Time, Entry_Time}

Closure of {ResidentID, TimeOfDep}:

{ResidentID, TimeOfDep}$^{+}$ = {ResidentID, Exit_Time Entry_Time }

Candidate Keys: {ResidentID, Exit_Time }

Primary Key: {Resident_Id, Exit_Time}

The given relation is in its highest normal form i.e, BCNF, since the LHS of all the functional dependencies are superkeys ({Resident_Id, Exit_Time }) for the relation.

8. COVID

Functional Dependencies:

Patient_Id → Patient_Id, Patient_Name, Recovered, Tested_Date

Closure of Patient_Id: Patient_Id^{+} = {Patient_Id, Patient_Name, Recovered, TestDate}

Candidate Keys: PatientID

Primary Key: PatientID

The given relation is in its highest normal form i.e, BCNF, since the LHS of all the functional dependencies are superkeys (PatientID) for the relation.

9. VACCINATION

Functional Dependencies:

{Resident_Id, Dose_No} → Resident_Id, Dose_No, Vaccine_Name, Date_Of_Dose

Closure of {Resident_Id, Dose_No}: {Resident_Id, Dose_No}$^{+}$ = {Resident_Id, Dose_No, Vaccine_Name, Date_Of_Dose}

Candidate Keys:

{Resident_Id, Dose_No}

Primary Key:

{Resident_Id, Dose_No}

The given relation is in its highest normal form i.e, BCNF, since the LHS of all the functional dependencies are superkeys ({Resident_Id, Dose_No}) for the relation.
